

Mcfk - carbon par excellence

Instructions : handlebar

Specifications:

Material: Carbon Prepreg

outside diameter: 25,4 mm / 31,8 mm – 22,2 mm

application area: MTB

Angle: 6 degree backward

Important Instructions for use:

The handle bar may be installed by the asymmetrical structure only in the intended way. At the right end of the handle bar is a in-laminated reference to the correct assembly.

On this sticker you can see a line with the inscription „oben / above ". To be sure that the handle bar was mounted on the correct way the line on the sticker **MUST** show upward after fastening!!! The following picture shows this circumstances again. This position is the ergonomically one and only correct position, the handle bar have to be installed like that way, without exception!

Pay attention to the permitted tightening torques!

Stem: max. 4 Nm

Levers clamping: max. 2,5 Nm

Barend clamping: max. 6 Nm, grips max. 2,5 Nm

If there are any sharp edges at the clamping parts these must be smoothed prior to fitting our handlebars using a file or emery paper.

Take care that no dirt or metal chips are trapped inside the tightening zone.

The bars may not be shortened.

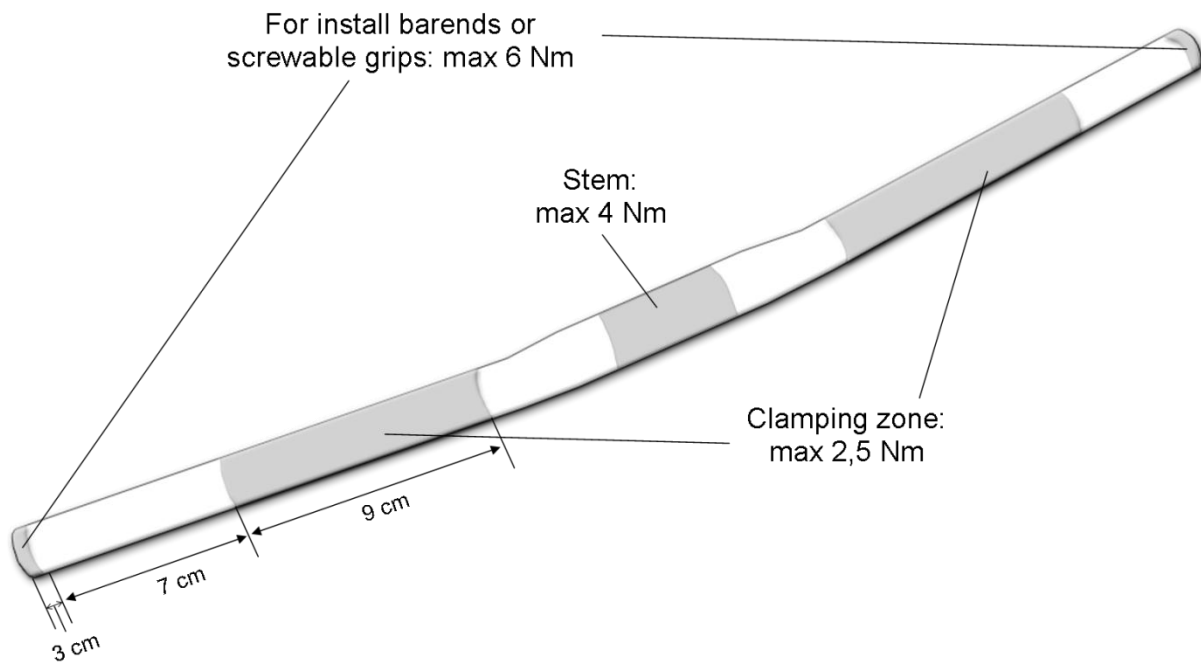

Do not tighten the screws to the specified maximum values at first. Start at the lowest specified values and check if the

connection is tight enough. If necessary increase the tightening torques, but do not exceed the specified maxima. Low

clamping forces relieve the bar and raise its long-life cycle.

If the specified maximum values are exceeded you put your safety

Mcfk - carbon par excellence
